AI Security Findings

Overall risk: LOW | Total findings: 1

Executive summary

Risk overview

Total findings: 1. Critical: 0, High: 0, Medium: 0, Low: 0.

Technical summary

[
{
"source_file": "/tmp/tmp8jhvv09n/dos_probe.py",
"risk_level": "high",
"key_issues": [
"Potential Denial of Service (DoS) vulnerability due to improper handling of input parameters allowing resource exhaustion.",
"Lack of rate limiting or throttle mechanisms increases risk of abuse by automated attacks.",
"Insufficient input validation exposing the application to malformed or malicious requests.",
"No existing logging or alerting to detect unusual traffic patterns indicative of an attack."
],
"quick_wins": [
"Implement input validation to restrict size and type of inbound parameters.",
"Add rate limiting to API endpoints to reduce impact from high frequency requests.",
"Enable logging and monitoring to detect anomalies and trigger alerts on suspicious activity.",
"Apply basic resource quotas and timeout limits to prevent system overload."
